

ABSTRACT OF THE DISCLOSURE

5 A plurality of ink cartridges are detachably attached to
a cartridge holder of an inkjet printer and are aligned in
parallel. Each ink cartridge includes a projection or a
recess formed at a side of the ink cartridge that faces the
adjacent ink cartridge. A set of the projection and the
matching recess of each pair of adjacent ink cartridges forms
10 a matching set in which the projection engages with the recess
to position the ink cartridges with respect to each other.
Each matching set has a different shape. Thus, when the ink
cartridges are attached to the cartridge holder, the ink
cartridges are connected together as aligned in a
predetermined order.
